## ABSTRACT OF THE DISCLOSURE

A resin-encapsulated semiconductor device includes a die pad, a semiconductor chip mounted on the die pad, and a The group of leads include at least three group of leads. kinds of leads, including first, second and third leads. While the first lead and the third lead are connected to each other upon production of the lead frame, the first lead and the third lead are separated from each other in a subsequent Moreover, a thin metal wire for connecting electrode of the semiconductor chip to the bonding pad of each lead, and an encapsulation resin for encapsulating the semiconductor chip, the leads, the thin metal wire, etc., are The pad of each lead is exposed on a surface of provided. the encapsulation resin so that the pad can function as an external terminal.
